The GPI series card readers are available with a twelve digit keypad that requires the user to provide a PIN in conjunction with a badge. Also available is a 2 line x 16 character LCD display that provides a sequence of instructions for the proper use of the reader and granted or denied access information.

The GPI2 series card readers can be used by facilities that require personnel to have access to multiple plants with one ID badge. These readers can locally distinguish up to seven different plants if a PIN is used or eight if not and send the correct badge information to the corresponding system.
